

## The Mighty-Brite - Model #700 Chemical Feeder System

The Mighty-Brite 700 Chemical Feeder takes the guesswork out of making chemical additions by automatically replenishing them at the same rate at which they are being depleted.

Based on the amount of current being used for electroplating, the Mighty-Brite makes metered additions of required chemicals thereby maintaining the plating solution at peak efficiency and performance.

The Mighty-Brite is to be quickly and easily installed and requires little maintenance or operator attention. The cabinet never needs to be opened as all settings are made from the front panel.

### How It Works

The Mighty-Brite is to be quickly and easily installed and requires little maintenance or operator attention. The cabinet never needs to be opened as all settings are made from the front panel.

The all solid-state microprocessing system is housed in a NEMA 4X corrosion resistant enclosure that is ready to mount in a convenient location. The independent metering pump is placed directly on to the user's liquid chemical storage container. The flow rate is set by adjusting the pump for the desired volume and setting the desired number of amp-hours at which the pump is to be activated.

### Features:

The Mighty-Brite has an 8-digit LED display for monitoring all functions of the system including:

- Total Accumulated Ampere-time
- Pump Cycle Preset Time
- Amp-time Set Point for Pump Activation

The Mighty-Brite features password setting protection and a battery back-up for accumulated information protection in the event of a power interruption.

### Specifications:

Accuracy: 0.5% of set-point (1-100 Mv)

AC Power: 115V, 50/60 Hz  
Ampere-time: Amp-minutes or hours

Cabinet: 6.25" L x 6.25" W x 4.25" H
